### WORKING PAPERS

1. [Lewis, Brittany](#), 2021, [“Creditor Rights, Collateral Reuse, and Credit Supply,”](#)

(previously titled: *The Effect of Dealer Leverage on Mortgage Quality*)

- Press: [Kelley School of Business News](#)
- AEA 2022: [Poster Presentation](#)
- *Accepted at the Journal of Financial Economics*

Securities dealers receive mortgages as collateral for credit lines provided to mortgage companies and reuse the same collateral to borrow money. Exploiting the 2005 BAPCPA rule change, which granted mortgage collateral preferred bankruptcy treatment, I find that strengthening creditor rights increases dealers' collateral reuse. Increasing collateral reuse creates a money multiplier that increases credit supply. Using a novel dataset linking dealers to the mortgage companies they fund reveals that post-BAPCPA, dealers supply

additional credit to mortgage companies by increasing credit lines and relaxing restrictions on collateral securing them. In response, mortgage companies increase origination volume and shift into riskier products.

2. [Lewis, Brittany](#), 2022, “**The Impact of Collateral Value on Mortgage Originations**”

In a model of contracting between a mortgage borrower and lender, we show that when the lender's outside option decreases, she lends to a new, previously dominated, market. The optimal mortgage contract in this market has an alternate structure relative to the standard market. We map the decrease in the outside option to a of strengthening creditor rights on mortgage-backed collateral in 2005. Following this change, we show empirically that lenders increase lending to high-income-variability borrowers using alternate mortgage products. The model offers insight into the sudden expansion of negative amortizing mortgage products leading up to the Great Financial Crisis, the products' ensuing defaults, and has implications for minority borrowers.

3. [Lewis, Brittany](#), 2020, “**Real Effects of Capping Bank Leverage,**”

In this paper, I study the effects of bank leverage ratio restrictions in a general equilibrium model of the macroeconomy where lenders can anticipate bank runs. This framework allows the analysis of the tradeoffs associated with bank capital requirements - while unlimited leverage allows capital to flow most freely to its most efficient users, limiting leverage through capital requirements reduces the probability of a bank run. This model enables me to study the general equilibrium effects of these tradeoffs on household welfare to understand characteristics of the optimal bank leverage ratio requirement. I find that the optimal leverage restriction will be time varying across the business cycle. When the household's marginal utility of consumption is highest, the leverage ratio requirement should be the least restrictive. Conversely, when the household's marginal utility approaches its steady state level, the optimal leverage ratio becomes more restrictive.
